ROBE STUDIO · THE COMPLETE GUIDE

One reel in, a finished robe video out.

Robe Studio makes ready-to-post TikTok and Reels videos for our heated hooded robes. You send it a reel that is working for someone else, or an idea of your own. It rebuilds the video with our robe, a new person and a new room, checks every frame, edits it with text and music, and hands you the MP4.

You never edit anything. No video editor, no files, no code, no settings. You talk to Claude in normal sentences, like texting a friend who edits videos for you. If you want something different, you just say it.

`~20 min` per video `1080×1920` · 9:16 `2 robes` · Snoopy, Princess

runs in your `browser`

FOR COMPLETE BEGINNERS

The words you'll see

You don't need to understand how any of this works. These are only so the names don't confuse you.

Claude	The AI assistant you chat with. It does all the work.
Claude Code (web)	The chat at `claude.ai/code` where Claude can work with your Robe Studio folder. That's where you talk to it.
GitHub	A free website that keeps your own online folder with the kit and your finished videos. You set it up once and never open the files.
Higgsfield	The website that creates the images and videos. Claude uses your Higgsfield account for that.

Reel	A short vertical video on Instagram or TikTok. The ones you send are the "references": videos that already get views.
Hook	The first 3–7 seconds of a video. It decides if people keep watching.
B-roll	The part where the person puts the robe on and shows it off.
Cozy ending	The last shot: the person relaxing in the robe.
Start frame	A photo Claude creates first, then brings to life as a video. Used for your own hook ideas.

THE FINISHED PRODUCT

What a video looks like

Every video follows the same proven order. The order never changes, which keeps things simple and reliable.

Hook	The copy of the reel you sent, or your own idea. This is what stops people scrolling.
Robe on	A new person in a new room puts the robe on, seen from the back and then the front.
Foot pockets	She opens the robe and steps into the foot pockets, one foot at a time, from the outside in.
Connector	Close-up of the heating cable clicking in, with that video's room softly blurred behind.
Remote	The remote's lights going up one by one: it heats.
Cozy	She relaxes in the robe. The classic version, or any ending you choose.

On top: the on-screen text (the reference's own words, or yours), music, and a caption with hashtags for you to copy.

NO COMMANDS

Everything you can ask

Write in your own words. These are examples, not commands to memorize.

Remake a reel that works

"Make this one with the princess robe: <Instagram or TikTok link>"

The main way to make videos. Pick reels with a strong first 3 seconds.

Your own hook idea

"I have an idea: she opens the front door and her mom holds a giant gift box"

Claude makes the first frame, shows it to you, you say OK and how it should move.

Choose the cozy ending

"Cozy: reading a book on the bed"

Claude asks before every video. Classic, or anything you imagine.

Use a specific song

"Use this song"

Drag an MP3 into the chat first. Claude puts the best part on the big moment.

Change something

"The text is too big · Use another song · The hood looks wrong at the end"

Only that part is redone, then the video is edited again.

New faces or rooms

"I want new girls · New rooms please"

Claude searches Pinterest and keeps only the good ones.

Ask for ideas

"Give me 3 hook ideas for the Snoopy robe"

Claude suggests hooks that are proven to work and haven't been used on your account yet.

Check what's left

"How many videos can I still make?"

Claude checks your Higgsfield account and answers roughly.

Install an update

"Here is the new update from Alex"

Drag Alex's update file into the chat first. Your videos and history stay.

How a reel is copied

When you send a link, Claude doesn't just "get inspired". It rebuilds the reel's hook so it moves and sounds like the original, but with our robe and different people.

1. **Downloads the reel and studies it frame by frame.**
   It writes down every action with its second and speed, for example "0–2.7 s she sways the rolled robe slowly; at 2.8 s she lets it unroll".

2. **Makes a list of every object and its job.**
   Before anything is generated, Claude writes down each object in their hook and what it is for. Their *product* becomes our robe, and it must clearly look like a robe (hood with the face, sleeves, full length), never a cape or a blanket. Their *packaging* becomes our box with our brand printed in the same spot (for example HEATGRUMP where their box says PRINCESSCOMFORT). A *decoration* themed like their product stays the same kind of object with our character on it: an Elsa blanket becomes a Grinch or Snoopy blanket, a Disney Princess pillow becomes a Grinch or Snoopy pillow. Plain things (a white blanket, a table, a shopping cart) and the place stay exactly as they are. Anything that belongs only to their product (a projector, a light) is removed. For every changed object Claude first makes a picture of it, checks it, and gives that picture to the video tool.

3. **Removes their caption, cleanly.**
   The text they put on top of their video is removed using a clean photo of the same spot, never with blur (blur would show up as a smudge in our video).

4. **Keeps their place as it is.**
   Store signs and logos in the scene stay exactly as in the original. Only the people and the product change.

5. **Changes the people.**
   Our person replaces theirs, and anyone else in the shot gets a clearly different face, so it is a remake, never a copy.

6. **Generates the new hook from their real footage.**
   The motion, speed and seconds stay identical: if their robe falls slowly at 2.8 s, ours does too. Their clip is cut to whole seconds before it goes in (the video tool only makes whole seconds, and stretches anything else), and the second-by-second timeline goes into the instructions.

7. **Put on the original's exact seconds.**

After generating, every cut of our hook is moved onto the second of the matching cut in theirs, and the hook ends exactly where theirs ends. Same length, same actions, same moments.

8. **Compares ours with theirs, side by side.**
Ten pictures per second, one row each. Anything faster, slower or different is regenerated.

> **On-screen text:** the video uses the reference's original text, word for word, with the same emojis. It worked for them; we keep it.

Your own hooks

When you describe an idea, Claude creates a realistic photo of the first moment with our person in her room, and shows it to you. You say OK or what to change, then how it should move and whether someone says something. Claude animates it, checks it and builds the rest of the video around it.

DEEP DIVE · SOUND

Voices and music

When people talk in the original

If the reel has a voice ("Three, two, one... let's see how it turns out!"), our hook says the same words on the same seconds. This step is never skipped:

1. **Who says what.**
Higgsfield's video analysis listens to the reel and writes down who speaks (man or woman, which tone) and the exact words.

2. **When each word falls.**
Claude separates the voice from their music and measures where every word starts, for example "three" at 0.18 s, "two" at 0.89 s, "one" at 1.42 s. Our hook moves the lips on those same seconds, so these are the seconds for our voice. If there is no voice at all, only a song, our hook gets no voice either: just our music from the start, with the big moment of the song on the reveal.

3. **The words go into the clip too.**
The words and their seconds also go into the video generation, so the lips and movements already fit the line.

4 **The voice is made separately.**
The video tool copies the whole sound of the original, their music too, so that sound is thrown away. Claude makes the same line again with a separate voice generator (Seedance), then places every word exactly on the second where it is said in the original, and measures again to be sure (within 0.05 s). Their music never ends up in your video.

5 **Checked afterwards.**
Claude compares the words and seconds of our hook with the original. If they don't match, the hook is made again.

Music

- Each robe has its own songs (for example Linus and Lucy for Snoopy, Let It Go for Princess). The chorus or the beat drop is placed exactly on the reveal.
- Want a different song? Drag the MP3 into the chat and say "use this song". Claude finds the best part and places it.
- **No music under the hook.** During the hook you only hear the voice. Our music starts exactly when the hook ends and the robe part begins, right on the song's drop, and plays loud to the end.
- Only exception: when the original has no voice at all, just a song, our music plays from the first second and its drop lands on the reveal.

DEEP DIVE · FACES AND PLACES

People and rooms

Every video uses a new person and a new room, so your account never shows the same girl twice in a row.

Where they come from

- The kit comes with **13 women and 26 rooms**, real photos of American-style cozy Christmas homes.
- When fewer than 5 are left, Claude **searches Pinterest by itself**, looks at every photo and keeps only those that pass: one woman, clear face not covered by a cup or phone, eyes open, real-looking, good light; rooms that are bright, real, with a Christmas tree, floor space and a sofa or a bed.
- Bad photos are thrown out automatically. You can also just ask for new ones anytime.

How the room is used

- **Room check:** sofa → the cozy shot happens on the sofa; only a bed → on the bed; neither → the room is skipped.
- **Always in the foreground:** the person is never behind a table, a plant or a chair. If the room photo has a table in the middle, Claude first makes a version of the room without it.
- **One place per video:** the same room for the hook (when it's at home), the robe, the connector, the remote and the cozy ending.
- **Outfit under the robe:** a different one each video (Christmas pajamas, a cozy set, a college sweatshirt), always long pants.

DEEP DIVE · SHOWING THE ROBE

The product part

- **B-roll:** made from our classic, tested movement clip, rebuilt with the new person, the new room and the robe copied exactly from its photos. The robe is never "described"; it is always reproduced from the real product pictures.
- **Foot pockets:** both feet start outside on the floor, then go in one by one. Never a foot already inside.
- **Every shot counts:** no shot is ever dropped to hide a problem. A bad shot is redone.
- **Connector and remote:** our real close-ups, with the background changed to that video's room.
- **Cozy ending:** the classic one from the B-roll, or a new 5-second shot of whatever you ask for: reading on the bed, hot cocoa on the sofa, wrapping gifts by the tree, a movie under the hood.

QUALITY

How mistakes are caught

AI video sometimes makes mistakes: a hand with six fingers, a robe that melts, a person who disappears. Robe Studio looks for them before you ever see the video.

CHECK	WHAT IT CATCHES
Every photo, looked at	Wrong face, wrong robe, extra fingers, text where there shouldn't be any
Hook vs original	Movement too fast or too slow, actions at the wrong second, a different length

Object list	An object with the wrong job: their decoration turned into our robe, a box without our brand, something from their product left in, our robe looking like a cape
Voice vs original	Missing words, words at the wrong time, a silent hook
B-roll shot count	A missing or invented shot
Glitch detector	Sudden jumps inside a shot: melting, a photo flashing in, a body part popping
Shot-by-shot look	Empty robe, missing head, second robe, wrong pockets, blur patches
Safe cuts	Cuts are placed away from the spots where AI glitches hide
Final video	Text always at the top, in the same place for the whole video; black frames, music, order of the parts

Anything that fails is redone with the problem written into the instructions, up to 3 times. If something still isn't perfect, Claude tells you exactly what and why.

YOUR ACCOUNT STAYS FRESH

Staying fresh

Robe Studio remembers what each video used: hook, person, room, outfit, music, on-screen text and cozy ending. The next video is always different from the last three, so followers never feel they're watching the same thing again. Before each video Claude also suggests a cozy ending you haven't used lately.

HONEST LIMITS

How far it can go

Works great

- Reels where one or two people do something with an object: reveals, countdowns, unboxings, try-ons, store displays, reactions.
- Hooks with spoken lines, matched on the second.
- Your own ideas: any scene you can describe in a sentence or two.

Harder

- Crowds or choreography with many people moving at once.
- Very fast cuts every half second.
- Tiny details close up, like text on a phone screen.
- Claude can't post for you or promise a video goes viral. The ideas you pick make the difference.

- Many videos a day: each takes about 20 minutes.

New robes, new formats and improvements arrive through Alex's updates, about once a week.

WHERE YOU MAKE THE DIFFERENCE

Your part

The technical work is handled. Your energy goes into ideas:

- **Find reels that already work:** short (10–20 s), lots of views, a strong first 3 seconds.
- **Invent your own hooks:** try one of your own for every two or three copied reels.
- **Change the cozy ending often.**
- **Post consistently,** and notice which hooks get the most views. Do more of those.

HELP

If something goes wrong

- **Claude says Higgsfield isn't connected:** open `claude.ai/customize/connectors`, connect Higgsfield again, start a new chat.
- **Claude says a download was blocked:** check the Network access step in the setup guide, then start a new chat.
- **Credits ran out:** top up on higgsfield.ai.
- **Anything else:** ask “what went wrong?” and Claude explains and fixes it. Still stuck? Write to Alex.
