ROBE STUDIO · SETUP

Ready in 5 minutes, all in your browser.

Never done anything like this before? Perfect, this is written for you. You click through five steps once. After that you only chat with Claude, like texting a friend.

`Claude Pro or Max` `Higgsfield account` `free GitHub account`

You don't edit anything. Ever.

No video editing, no files, no code, no settings to change later. You send a reel or an idea, Claude makes the whole video, checks it, and hands you the finished MP4. If you want something different, you just tell Claude in a normal sentence.

Two words you'll see:

GitHub is a free website that keeps your own online folder. In it lives the Robe Studio kit and your finished videos. You never open the files yourself.

Claude Code is a chat with Claude at claude.ai/code that can work inside that folder. That's where you talk to Claude.

`0 of 5 done`

1 Get your own copy of the kit

No GitHub account yet? Go to `github.com`, click **Sign up** and make a free account (email + password).

Then open the Robe Studio link you received. You'll see a green button at the top right:

Use this template → **Create a new repository**

In the box **Repository name** write `robe-studio`. Choose **Private** (only you can see it). Click the green **Create repository** at the bottom.

That's it: you now have your own copy of the kit. You don't need to look inside it.

☐ Done

2 Connect Higgsfield

Higgsfield is the website that makes the images and videos. Claude uses your account there.

Open `claude.ai/customize/connectors` (log in to Claude if asked). Find **Higgsfield** in the list:

Higgsfield → Connect → log in with your Higgsfield account → Allow

When it says "Connected", this step is done.

- [ ] Done

3 Open Claude Code

Go to `claude.ai/code`.

The first time it asks to connect GitHub. Click Connect GitHub, log in, and when GitHub asks which folders Claude may use, choose **robe-studio** and click Install / Save.

Back on claude.ai/code, choose **robe-studio** from the list. A chat box opens.

- [ ] Done

4 Let it reach Instagram and TikTok

Next to the chat box there's a small cloud icon with a name (usually "Default"). Click it, then the little pencil / **Edit**.

Find Network access → choose Full → Save

This lets Claude download the Instagram and TikTok reels you send it. You do it once and never again.

- [ ] Done

5 Say hi

Write in the chat:

> *Hi, set me up*

Press Enter and wait a few minutes. Claude prepares everything by itself and writes back when it's ready. If it asks you something, just answer in normal words. If a window pops

up asking to allow something, click **Allow** / **Yes**.

- [ ] **Done**

EVERY DAY AFTER THAT

Just talk to Claude

No commands to learn. Write like you'd text a friend who edits videos for you:

> *Make this one with the princess robe: https://www.instagram.com/reel/...*

> *I have my own idea: she opens the front door and her mom holds a giant gift box.*

> *The text is too big.*

Claude asks you one question (which cozy ending you want), then makes the video, checks every frame and gives you the finished MP4 and a caption to copy. You don't cut, edit or fix anything. To save the video: click it in the chat and download it. (It's also kept in your GitHub folder, under `output`.)

Your part is the ideas. Copy reels that work, and every two or three videos try a hook of your own.

If something goes wrong

- **Claude says Higgsfield isn't connected:** redo step 2, then start a new chat.
- **Claude says a download was blocked:** check step 4, then start a new chat.
- **Anything else:** ask *"what went wrong?"* and Claude explains and fixes it.
